                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     lssued_Patents_NA:*

is Sequence 308, Application US/09620412C
is Patent No. 6446234
is GENERAL INFORMATION:
APPLICANT: Steven P. Fling
ITILE OF INVENTION: COMPOSITIONS AND METHODS FOR TREATMENT AND
ITILE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION
FILE REPERENCE: 210121.469C7
CURRENT APPLICATION NUMBER: US/09/620,412C
CURRENT FILING DATE: 2000-07-20
NUMBER OF SEQ ID NOS: 363
is SOFTWARE: FastsEQ for Windows Version 3.0/4.0
is LENGTH: 1860
                                                                                                Sequence 336, Application US/09598419

Sequence 336, Application US/09598419

Patent No. 6656856

GENERAL INFORMATION:

APPLICANT: Scholler, John

TITLE OF INVENTION: COMPOUNDS AND METHODS FOR TREATMENT AND

TITLE OF INVENTION: DIAGNOSIS OF CHLAMYDIAL INFECTION

FILE REFERENCE: 210121.469C6

       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CBS97827

/tissue_type="cambial zone harvested on the bark side"
/dev_stage="3-years-old poplar trees grown in the nursery"
/clone_lbe="poplar cDNA library from cambial zone"
/clone_lbe="poplar cDNA library from cambial zone"
/note="A composite cDNA library was made with mRNA
isolated from opposite and tension wood tissues
corresponding to the cambial zone collected on the bark
side after debarking the stem. In this respect, in
addition to cambium cDNA, this library also contains very
young phloem and very young xylem cDNA. The sampling was
done on 3 different tilted trees grown in the nursery.
CDNA were cloned in an oriented way into SfiI (A and B)
restriction sites. A one-step conversion of Lambda
Triplex2 to the corresponding priplex2 plasmid was done
via site-specific recombination at loxP sites (Clontech;
SMART CDNA library construction kit). CDNA inserts were
RCR amplificad using glanking primers and then sequenced on
a ABI3100 Genetic Analyser (Applied Biosystem)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CF619317

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

The invention describes an isolated polymucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polymucleotide and/or polympeptide is useful for treating a lung cancer in a patient. The polymucleotide is useful for removing tumour calls from a biological sample. The polymucleotide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This sequence encodes a lung tumour associated protein or protein described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but two. was obtained in electronic format directly from WIPO at

The invention relates to a polymuclectide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in the specification, or a sequence (S2) mentioned in specification.

CC (maplement of S1, sequences consisting of at least 20 contiguous residues (CC of S1, sequences having 75%, preferably (CC of S1, sequences than hybridise to S1, Also included are an isolated polympeptide (comprising a sequence (S3) selected from any one of the 4 amino acid sequences mentioned in the specification, a sequence conded by the polymuclectide, or sequence encoded by the polymuclectide, or expension overtor comprising the polymuclectide, an expression overtor comprising the polymuclectide, and the vector, an isolated anibody (or its antigen binding fragment) that specifically binds to the polympeptide, detecting the present of a cancer in a patient, a fusion protein comprising the polympeptide, an olithonis, stimulating and/or expanding T cells specific for a tumour protein (comprising contacting) relis with the polymuclectide, protein conditions, stimulation and/or expanding T cells specific for a tumour protein (comprising contacting) relis with the polymuclectide, protein or antigen presenting cells, under conditions and for a time sufficient to permit the stimulation and/or expanding T cells and inhibiting the development of a cancer in presenting cells that express the polymuclectide, protein or projection or antigen proper sequence in a patient with the polymuclectide, protein or projection for stimulating an immune response in a patient, and for the protein or projection or the polymuclectide, protein and sequence of a cancer in a patient. The polymuclectide, protein compositions, e.g. vaccines. The polymuclectide is also useful as a protein compositions, e.g. vaccines. The polymuclectide is a patient (particular product of a cond hybridisation, and in
                                                                                                                                                                                                                      Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 186 BP; 39 A; 61 C; 47 G; 39 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Conservative:

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polynucleotide associated with the compositions and methods for the therapy and diagnosis of lung cancer

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 kba in an an infrastance of the comprising a polynucleotide sequence of the compinant fragment of serine protease antigen MTB32A of the recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.
                                                                                                                                                                          Ral2; serine protease antigen; MTB32A; Mycobacterium tuberculosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated polypeptide (I) comprising 7-30 consecutive amino acid residues of human mammaglobin, where one or more mammaglobin specific T cells specifically reacts with (I). Also included the armaglobin specific T cells specifically reacts with a physiologically acceptable carrier or immunostimulant; (2) a diagnostic kit, comprising (I), in compination with a physiologically acceptable carrier or immunostimulant; (2) a diagnostic kit, comprising the forestion reagent comprising a reporter group; (3) removing tumour cells from a biological sample, by contacting a biological sample with T cells that specifically react with (I), under conditions and for a time sufficient to permit the removal of cells conditions and for a time sufficient to permit the sample; (4) and isolated T cell population (II), comprising T cells prepared using (I), and (5) a composition (II), comprising a poly.uclectide comprising a not affinity tag), or a polypeptide comprising a human mammaglobin (or variant or tagged with an affinity tag), in combination with an

immunostimulant. The peptide is useful for inhibiting the development of breast cancer in a patient, by incubating CD4+ and/or CD8+ T cells isolated from a patient with a mammoglobin epitope, such that T cells proliferate, administering the proliferated T cells to the patient, optionally cloning at least one proliferated T cell and administering at least one cloned cell, and thus inhibiting the development of breast cancer in the patient. The compositions and methods are useful for sequence encodes a human mammaglobin/RA12 fusion protein. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytostatic, epitope, mammaglobin, mgb, therapy, breast cancer, diagnosis, vaccine, human, chimeric, fusion protein, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 ThralaalaSeraspasnPheGlnLeuSerGlnGlyGlyGlyGlnGlyPheAlaIleProIle

The present invention provides polypeptide epitopes of human mammaglobin (mgb) useful for the therapy, diagnosis and monitoring of breast cancer. The invention is related to specific epitopes of mammaglobin, to antibodies and immune cells that recognise such epitopes and to methods for detecting mammaglobin in patient serum. These peptides, antibodies and cells may be useful in vaccines and pharmaceutical compositions for prevention and treatment of breast cancer. The invention is also useful to detect and /or monitor the progression of breast cancer. The present sequence is Ral2 (s)-human MammFL chimeric DNA construct used in the expression of recombinant Ral2(s) MammFL, a fusion protein consisting of full length human mammaglobin with short Ral2. This protein is used in the exemplification of the invention
diagnosis and monitoring

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence encodes a specifically claimed M. tuberculosis antigen, Tbhall. The immunogenic polypeptide can be used to diagnose M. tuberculosis in frection by forming complexes with specific antibodies in the sample. Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic princers or probes and agents that bind to the antigen, especially monoclonal antibodies or equivalent polyclonal antibodies, are also used for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11 acceccecercearaacriccaecrerccaecresescaesescaraescarreceare 70

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence encodes a specifically claimed M. tuberculosis antigen, TbRal2. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against
                                                                                                                                                                                                                                                                                                                                                                                                                                                             11 ACGGCCGCCTCCGATAACTTCCAGCTGTCCCAGGGTGGGCAGGGATTCGCCATTCCGATC 70
                                                                                  New immunogenic polypeptide(s) from Mycobacterium tuberculosis - are useful in vaccines for prevention or treatment of tuberculosis, also for diagnosis.

Thrais Case AAWG4294). It was isolated from a M. tuberculosis strain things appearant to the invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAWG4291-W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also calained are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using these polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis.                                            Immunogenic Mycobacterium tuberculosis polypeptide(s) and DNA - used to develop products for the detection of M. tuberculosis infection and for diagnosis, treatment and prevention of tuberculosis.
                                                                                                      This sequence encodes an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                            ThralaalaSeraspasnPheGlnLeuSerGlnGlyGlyGlnGlyPheAlaIleProIle

The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M. tuberculosis Ag's. M. tuberculosis Ag's. DNAs encoding them, derived fusion proteins and other polypeptides fragments, can be used in pharmaceutical compositions or vaccines to generate a protective or therapeutic immune response to M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            11 ACGCCCCCCTCCCATAACTTCCAGCTGTCCCAGGGTGGGCAGGATTCGCATTCCGATTC 70
This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypeptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.

Compositions comprising at least 2 heterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vacines to prophylactically immunise mammals (especially
tuberculosis and as reagents in skin tests for diagnosis of tuberculosis. Ag can induce proliferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AAZ19249 to AAX19460 and AAX19083 to AAX39225 are used in the exemplification of the present invention

Composition comprising MTB39 antigen and MTB32A antigen from
Mycobacterium species, useful for eliciting immune response in a subject.
polypeptide or its fragment. The Leishmania polynucleotide is selected from TSA, LeIF, M15, and 6H polynucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are useful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raising antibodies in a non-human animal. The invention is used in gene therapy. The present sequence is M. tuberculosis Ral2 (C-terminus of MTB32A; RA35FL) antigen encoding DNA

The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and comprising such fusion proteins. The present invention particularly relates to mucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase include two or more individual M. tuberculosis antigens which increase the eschoglocial sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and treatment of tuberculosis infection. Sequences of the invention are useful for abliciting an immune response in a mammal, e.g., human, useful and the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the prevention of Mycobacterium infection. The fusion proteins and the molycobacterium, in vitro and in vivo assays for detecting humoral artibodies or call-mediated immunity against M. tuberculosis, for the diagnosis to generate or elicit a protective immune response in a parient and for raising anti-M. tuberculosis antibodies in a non-human contains of the invention are also used as vaccines MTB32A, fusion proteins of the invention are useful as in vivo diagnostic agents for animal sequence of the invention are useful as in vivo diagnostic agents when any arms and for raising anti-M. The present sequence is Mycobacterium species for intradermal skin test. The present sequence is Mycobacterium species and any arms are useful as in vivo diagnostic adminestration arms and any arms 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ral2; serine protease antigen; WTB32A; Mycobacterium tuberculosis;

for diagnosing, for use in

```
The present invention describes polymucleotide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The ancer that is diagnosed or treated is particularly prostate cancer. (I) and (III) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (III) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAAH933357 to AAH93344 and AAMO1115 to AAMO1318 represent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                    The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 Kbaic and C-terminal fragment of serine protease antigen MTB32A of equence.

Mycobacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence represents the DNA encoding the Ral2. mammaglobin fusion protein. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ThralaalaSerAspAsnPheGlnLeuSerGlnGlyGlyGlnGlyPheAla1leProlle 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         25 ACGGCCGCGTCCGATAACTTCCAGCTGTCCCAGGGTGGGCAGGGATTCGCCATTCCGATC 84
                                                                                                                                                                                              Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; prostate cancer; prostate-specific; diagnosis; vaccine; cytostatic; gene therapy; metastasis; ss.

 The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antignic epitopes derived from them) and antignn-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The prostate specific polynucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           81
                                                                                                                                                                                                                                              human prostate-specific polypeptides and polynucleotides useful for diagnosis and treatment of cancer, especially prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prostate cancer; vaccine; gene therapy; cytostatic; fusion protein; immunogen; cancer; prostate specific antigen; PSA;

The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 % sequence identity to any one of the 35 sequences defined in the USPIO web site, which is encoded by any of the 4 nucleotide sequences not defined in the specification. The fusion protein, composition and methods are useful for diagnosing, preventing and/or treating cancer, particularly prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This sequence represents a prostate cancer form part of the printed specification, but was obtained in electronic form part directly from the US patent office at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polynucleotide, useful for

The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the disgnosis and treatment of cancers, particularly prostate cancer. The present sequence is a CDNA described in the invention. (Updated on 29-AUG-2003 to standardise OS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Xu J, Dillon DC, Mitcham JL, Harlocker SL, Jiang Y, Henderson RA;

The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to illustrate the invention
                               New prostate-specific proteins and genes, useful in gene therapy, particularly for stimulating an immune response in a patient, or treating prostate cancer in a patient, as well as for diagnosing prostate cancer in a patient.

The invention relates to an isolated polypeptide comprising no more than the invention relates to an isolated polypeptide comprising on the invention relates to an isolated plant of the contain naturally processed T-cell epitopes for 3 class I major histocompatibility complex (MHC) T-cell epitopes for 3 class I major histocompatibility complex (MHC) and the proteins and peptides, expression vectors, a host cell comparing the proteins and peptides, expression vectors, a host cell comparing the protein and peptides, expression vectors, a host cell craneformed with the vector, an isolated antibody for antiple bridge containing agent that binds to the protein or peptide, detecting a patient comprising as Abalis5s, detecting the amount of polypeptide that binds to the agent and comparing the amount of cancer), a fusion protein cappearing the peptides or proteins, stimulating or expanding T cells of a predetermined cut-cell applied for a predetermined cut-cell experience or a protein comprising the peptides or protein comprising the peptides or protein comprising the peptides or protein comprising or expanding T cells cancer in a patient and treating prostate cancer in a patient with the peptides or antigen presenting cells that express the concursing contacting cells that express the peptides or that hybridies to nucleic and encoding them), is used to detect the contacting cells are the patient. The peptides (or an oligonucleotic contact and apatient may apatient. The peptides, mucleic acids encoding, or antigen presenting cells expressing the nucleic acids and administering cells expressing the nucleic acids and administering cells expressing the nucleic acids, are used to stimulate or expand T cells specific for a tumour protein. The peptides or treat the present cancer in a patient. The peptides (or an oligonucleon or antigen protein cancer in a patient. The present expense of cancer in a 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the printed specification, but was obtained in electronic format directly from USPTO at segdata.uspto.gov/sequence.html?Doc1D=20030185830.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polypeptide for use in a vaccine for stimulating an immune response, or for treating or diagnosis cancer, preferably prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 675 BP; 162 A; 197 C; 190 G; 126 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 17; Page; 101pp; English.

RESULT 23

8 d ઠ

```
The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polynucleotide sequence of Ral2, a 14 (Sta C-terminal fragament of serine protease antigen MTB2A of a 14 Mycobacterium tuberculosis, and a heterologous polynucleotide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both cukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This polynucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ral2; serine protease antigen; MTB32A; Mycobacterium tuberculosis; vaccine; eukaryotic; prokaryotic origin; serum antibody; fusion protein; immunogen; cytokine; gene; ds.

The DNA is useful for the recombinant production of the fusion protein. Coding sequences for the antigens were modified by PCR in ord; to facilitate their fusion and subsequent expression of the fusion protein. and then ligated. The invention provides fusion proteins (see AAY32059-71) containing at least 2 M. tuberculosis antigens. The new fusion proteins and polymuclectides encoding them are useful as vaccines for preventing tuberculosis claimed), for diagnosis (via in vitro assays or intradermal skin tests for detection of anti-M. tuberculosis antibodies), monitoring of disease progression, and treatment of tuberculosis. They are more effective
                                                                                                                                                   1 ThrAlaAlaSerAspAsnPheGlnLeuSerGlnGlyGlyGlnGlyPheAlaIleProIle 20

The invention relates to a purified polypeptide which induces an immune response of Mycbacterium tuberculosis. Polypeptides of the invention are useful for diagnosing, treating or preventing M. tuberculosis infection, particularly tuberculosis; prection. In particular, the polypeptides are useful as a vaccine formulation with an adjuvant to afford long-term protection in animals against the development of tuberculosis. The protein coding sequence may be used to encode a protein product for use as an immunogen to induce and/or enhance an immune response to M. tuberculosis. This sequence represents DNA encoding an M. tuberculosis tuberculosis, protein of the invention. This polymucleotide encodes 3 different proteins, each in a different reading frame. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     20

The invention describes an isolated polynucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating lung cancer in a patient. The polynucleotide is also useful for treating a lung cancer in a patient. The polynucleotide is also useful for treating probe or primer to detect the level of manA encoding a tumour protein. This sequence encodes a lung tumour associated protein or protein described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                        Mcnabb A;
                                                                                                                                                                                                                                                                                   Novel polynucleotide encoding a lung tumor polypeptide useful for stimulating and/or expanding T cells specific for a tumor protein.
                                                                                                                                                                                         Wang T, Watanabe Y, Henderson RA, Johnson JC, Retter MW;

```
The invention relates to a polymuclectide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in the specification, or a sequence (22) mentioned in specification, or a sequence selected from any of the 14 sequences mentioned in the specification, or a sequence complement of S1, sequences that hybridise to S1, sequences having 75% preferably 0%, identity to S1, or despensate variants of S1. Also included are an isolated polymotlectide, or sequences having 15% preferably of the polymotlectide, or sequences having at least 70%, or despensate variants of S1. Also included are an isolated polymotlectide, or sequences having at least 70%, or expression or vector comprising the polymotlectide or an expression control sequence, a host cell transformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that specifically binds to the polymotlectide by polymotlectide, an oliginal polymotlectide that hybridises to S1 under moderately stringent conditions, atimulating and/or expanding T cells specific for a tumour protein (comprising contacting cells, under conditions and for a time sufficient to permit the stimulation and/or expanding T cells specific for a tumour protein (comprising contacting the polymotlectide, protein or antigen-presenting cells, under conditions and for a time sufficient to proliferated T cells and thus inhibiting the development of a cancer in presenting cells that express the polymotlectide, protein or antigen presenting cells, under conditions and publication or cells isolated from a patient with the polymotlectide, protein or expension of the protein or antigen. The polymotlectide, protein an effective amount of the proliferated T cells and thus inhibiting the development of a cancer in composition for stimulating an immune response in a patient, and patient (particularly lung cancer of a cancer in patient. The protein and oligonuclectide is protein consostions, e.g. vaccines. The polymotlectide is protein compos

lung cancer in a patient. The polypeptide is useful for removing tumour cells from a biological sample. The polybucicetoide is also useful as probe or primer to detect the level of mRNA encoding a tumour protein. This sequence encodes a lung tumour associated protein or protein. Fragment, described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at
                                                                                                                                                                                                                                                                                                                                                                                       ftp.wipo.int/pub/published_pct_sequences

Novel lung cancer polynucleotide encoding lung cancer protein, useful for detecting the presence of lung cancer in a patient, and in pharmaceutical compositions, e.g. vaccines, for treating lung cancer.

Example 10; Page; 72pp; English

The invention relates to a polynuclectide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in the specification or a sequence selected from any of the 14 sequences mentioned in the specification.

The specification or a sequence consisting of at least 20 contiguous residues of \$1, sequences that hybridise to \$1, sequences having \$2\$, preferably \$0\$, identity to \$1, or degenerate variants of \$1. Also included are an isolated polypeptide (comprising a sequence (83) selected from any one of the 4 amino acid sequences mentioned in the specification, a sequence encoded by the polynuclectide, or expression vector comprising the polynuclectide operably linked to an expression vector comprising the polynuclectide operably linked to an expression vector comprising the polynuclectide operably linked to an expression vector comprising the polynuclectide operably linked to an expression ording on the polynuclectide operably linked to an expression ording of the polynuclectide operably linked to an expression ording on the polynuclectide operably linked to an impact of the polynuclectide operably linked to an expression ordition, such the polynuclectide, protein conditions, stimulation and/or expanding the polynuclectide, protein or antigen protein (comprising cells, under conditions and for a time sufficient to permit the stimulation and/or expandion of T cells and inhibiting the development of a cancer in a presenting cells that express the polynuclectide, such that T cells approximated from a patient (by incubating the presence of a cancer in the patient. The polynuclectide, such that T cells are the patient with the polynuclectide, such that T and or the patient. The polynuclectide is not the patient (particularly lung cancer). The composition is useful for decenning the presence of a cancer in a patient (particularly lung cancer). The present sequence encodes a fusion of the polynuclectide is useful for isolating a full or head of the print of a sequence encodes a tr segdata.uspto.gov/sequence.html?DocId=20020197669
